

Configuration Archive and Change History Management Tracked Resources

These are the Avaya Communication Manager resource types tracked by the Consistacom Configuration Archive / Change History Management Service version 1.4.0.4 and above.

Caution: A resource type's appearance in this table does not imply support in any other Consistacom application, including Multi-System Synchronization. Refer to the particular application's documentation for a list of supported types.

The most recent values of all resources in this list are available for retrieval from the Consistacom ACD Directory, located on the Consistacom Synchronization Controller.

Note 1: Administrator’s procedure or Communication Manager design may lead to missing real time object change events for these resource types. One example: using “change announce 10003” and changing announcement 10003 *plus* a second announcement will cause the second change to go unrecorded until the next scheduled data synchronization. Changing a single announcement *other than* 10003 will likewise result in a missing event.

Note 2: These resources are typically scheduled for daily update during a busy hour, so the number of licenses in use approximates the actual maximum.
